

LEVONORGESTREL (implant)

lee-voe-nor-jes-trel

What does it do?

Levonorgestrel is used to prevent pregnancy.

How is it given?

Two implants are inserted under the skin in your upper arm by a health professional. They can stay in place for a maximum of 5 years.

Visit the Family Planning website for more information:

Can you take other medicines?

Tell your pharmacist or doctor about all medicines or treatments that you may be taking, including vitamins, herbal products (e.g. St John's wort) or recreational drugs.

What side effects might you notice?

Side Effects	Recommended action
Changes in periods	Irregular bleeding is common in the first 3-6 months. This is not harmful and usually improves with time. After this, some women will not have any periods at all.
Mood changes, headache Acne Weight gain Sore breasts Stomach upset Bleeding or itching at implant site	Tell your doctor if troublesome

If you notice any other effects, discuss them with your doctor or pharmacist.

Other information:

- Tell your doctor if you have breast cancer.
- Keep the implant area dry for a few days after it is inserted and follow your doctor's instructions on when to remove the dressing and/or bandage.
- See your doctor if you cannot feel your implant, if you notice any changes around your implant, or if you become pregnant.
- Your implant does not protect you from sexually transmitted infections.
- You can ask to have your implant removed at any time. This must be done by your health professional – do not remove it yourself. The implant can be hard to remove in a small number of women; you may need more than one visit to the clinic if this is the case.
- You can get pregnant as soon as your implant is removed.
